AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (original) Apparatus for measuring an arrival time of a photon, said apparatus comprising:

a photocathode operable to emit an electron when struck by said photon;

a sensor disposed to detect said electron emitted by said photocathode; and

an electric field generator operable to generate an electric field to accelerate said

electron emitted by said photocathode toward said sensor; wherein

said electric field generator is operable to generate an electric field varying with time such that said electron is incident upon said sensor with an arrival energy dependent upon said arrival time of said photon; and

said sensor is operable to provide an output signal indicative of said arrival energy.

- 2. (original) Apparatus as claimed in claim 1, wherein said sensor is a CCD sensor operable to store a charge dependent upon said arrival energy.
- 3. (original) Apparatus as claimed in claim 2, wherein said CCD sensor comprises a plurality of pixel cell detectors, different pixel cell detectors being operable to measure a respective arrival energy of an electron corresponding to a photon incident upon said photocathode.

Klaus SUHLING U.S. National Phase of PCT/GB2004/000324

- 4. (original) Apparatus as claimed in claim 3, wherein each pixel cell detector upon which an electron has been incident outputs a signal dependent upon said arrival energy.
- 5. (currently amended) Apparatus as claimed in any one of the preceding claims claim 1, wherein said electric field generator is operable to generate a voltage difference between said photocathode and said sensor which changes with time starting from a trigger point.
- 6. (original) Apparatus as claimed in claim 5, wherein said voltage difference is a periodic signal.
- 7. (original) Apparatus as claimed in claim 6, wherein said periodic signal has a frequency of between 0Hz and 1000Hz.
- 8. (currently amended) Apparatus as claimed in any one of the preceding claims claim 1, wherein said electric field generator is operable to generate a voltage between said photocathode and said sensor of between 5kV and 10kV.

Klaus SUHLING U.S. National Phase of PCT/GB2004/000324

- 9. (currently amended) Apparatus as claimed in any one of the preceding claims claim 1, comprising an attenuator disposed to attenuate photons arriving at said photocathode.
- 10. (currently amended) Apparatus as claimed in any one of the preceding claims claim 1, wherein said photons have a wavelength between 10nm and 1000nm.
- 11. (currently amended) Apparatus as claimed in any one of the preceding claims claim 1, wherein said photocathode and said sensor are formed as a sealed structure substantially having a vacuum between said photocathode and said sensor.
- 12. (currently amended) Apparatus as claimed in any one of the preceding claims claim 1, wherein said apparatus is a fluorescence lifetime imager.
- 13. (currently amended) Apparatus as claimed in any one of claims 1 to 11 claim 1, wherein said apparatus is a detector for a time-of-flight measurement of photons for non-invasive IR imaging.
- 14. (currently amended) Apparatus as claimed in any one of claims 1 to 11 claim 1, wherein said apparatus is a single shot time correlated single photon counter.

15. (original) A method of measuring an arrival time of a photon, said method comprising the steps of:

emitting an electron from a photocathode struck by said photon;

generating an electric field to accelerate said electron emitted by said photocathode toward a sensor; and

detect with said sensor said electron emitted by said photocathode; wherein said electric field varies with time such that said electron is incident upon said sensor with an arrival energy dependent upon said arrival time of said photon; and said sensor provides an output signal indicative of said arrival energy.

- 16. (original) A method as claimed in claim 15, wherein said sensor is a CCD sensor operable to store a charge dependent upon said arrival energy.
- 17. (original) A method as claimed in claim 16, wherein said CCD sensor comprises a plurality of pixel cell detectors, different pixel cell detectors being operable to measure a respective arrival energy of an electron corresponding to a photon incident upon said photocathode.
- 18. (original) A method as claimed in claim 17, wherein each pixel cell detector upon which an electron has been incident outputs a signal dependent upon said arrival energy.

Klaus SUHLING U.S. National Phase of PCT/GB2004/000324

- 19. (currently amended) A method as claimed in any one of claims 15 to 18 claim 15, wherein said electric field generator is operable to generate a voltage difference between said photocathode and said sensor which increases with time starting from a trigger point.
- 20. (original) A method as claimed in claim 19, wherein said voltage difference is a periodic signal.
- 21. (original) A method as claimed in claim 20, wherein said periodic signal has a frequency of between 0Hz and 1000Hz.
- 22. (currently amended) A method as claimed in any one of claims 15 to 21 claim 15, wherein said electric field generator is operable to generate a voltage between said photocathode and said sensor of between 5kV and 10kV.
- 23. (currently amended) A method as claimed in any one of claims 15 to 22 claim 15, comprising an attenuator disposed to attenuate photons arriving at said photocathode.
- 24. (currently amended) A method as claimed in any one of claims 15 to 23 claim 15, wherein said photons have a wavelength between 10nm and 1000nm.

Klaus SUHLING U.S. National Phase of PCT/GB2004/000324

- 25. (currently amended) A method as claimed in any one of claims 15 to 24 claim 15, wherein said photocathode and said sensor are formed as a sealed structure substantially having a vacuum between said photocathode and said sensor.
- 26. (currently amended) A method as claimed in any one of claims 15 to 25 claim 15, wherein said method is part of a method of fluorescence lifetime imaging.
- 27. (currently amended) A method as claimed in any one of claims 15 to 25 claim 15, wherein said method is part of a method of detection for time-of-flight measurement of photons for non-invasive IR imaging.
- 28. (currently amended) A method as claimed in any one of claims 15 to 25 claim 15, wherein said method is part of a method of single shot time correlated single photon counting.
